ShiftWatt

Same electricity.
Cleaner hours.

Runs the things that can wait, like your EV, dishwasher and laundry, when the grid is cleanest, before the deadline you set.

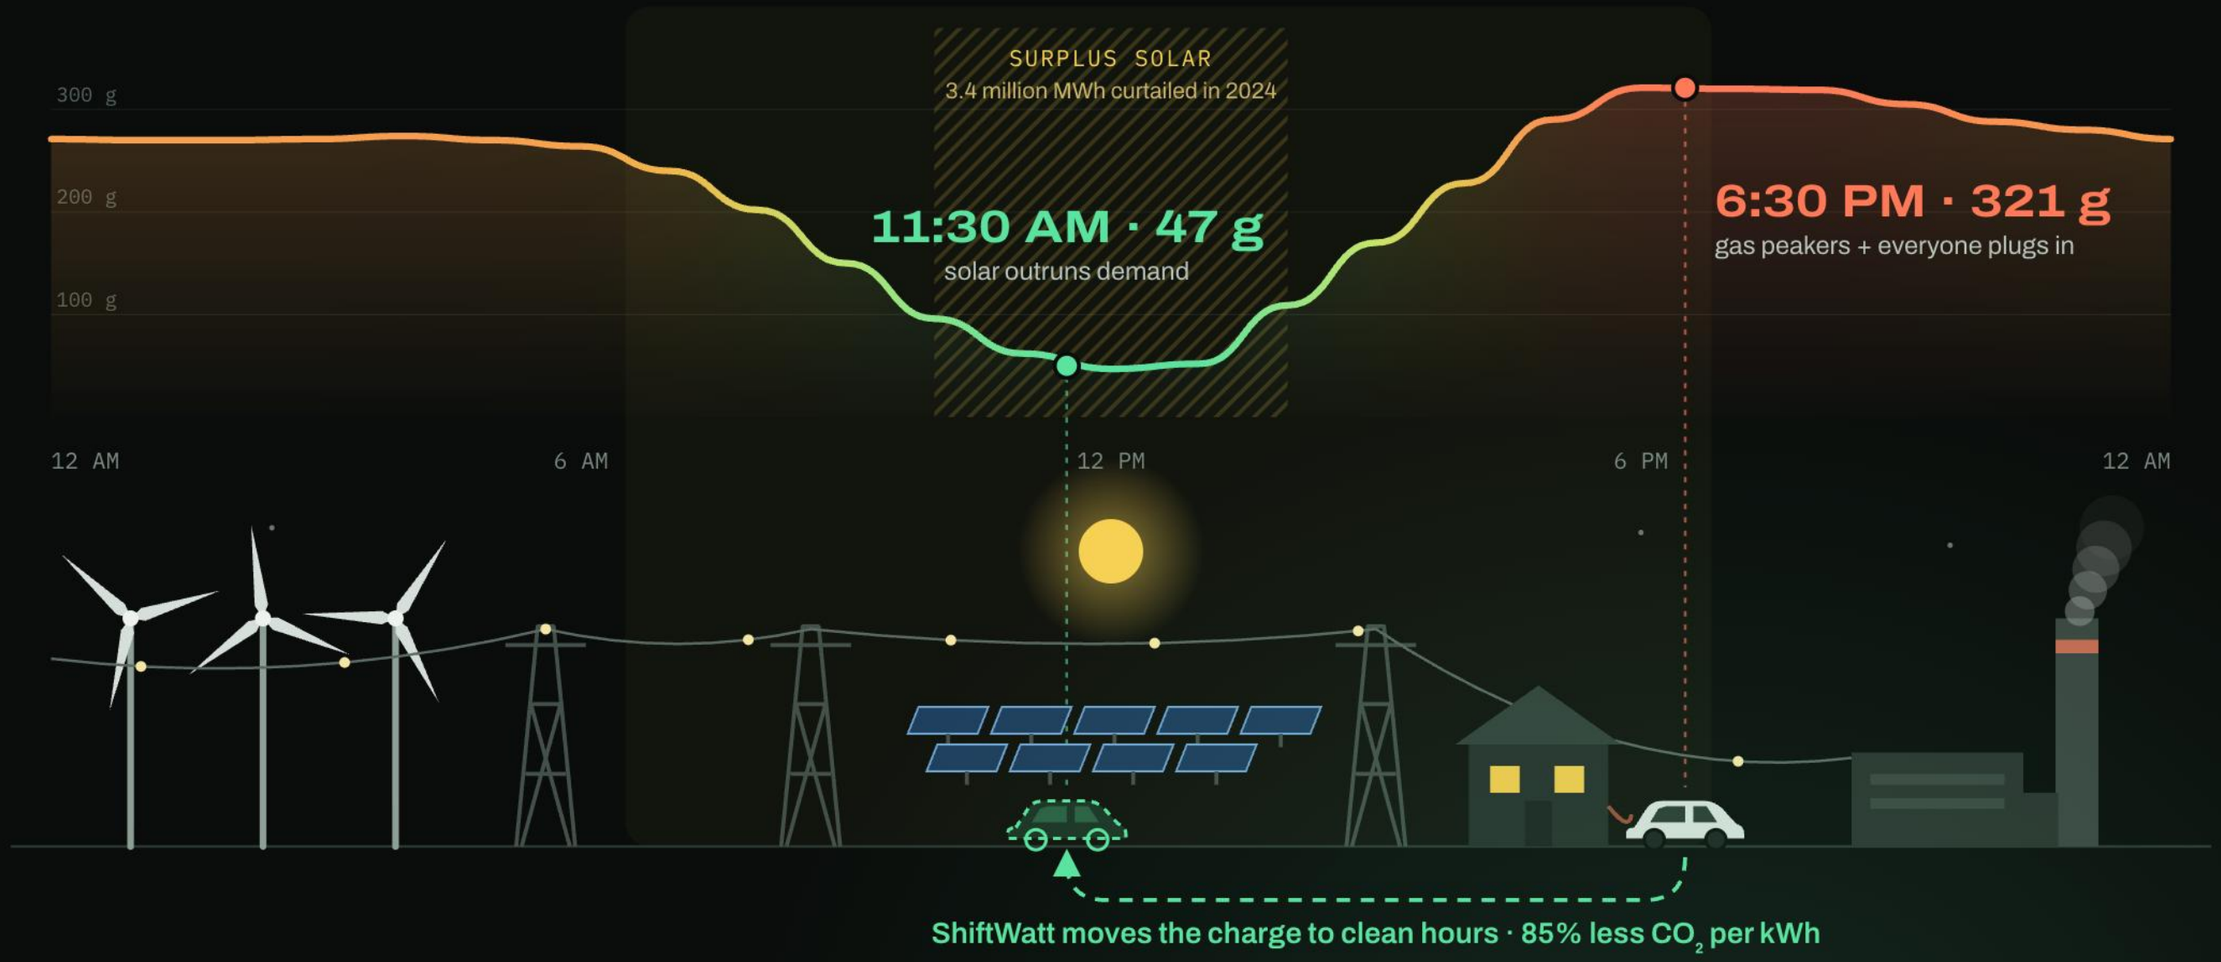

6:30 PM · 321 g tomorrow 11:30 AM · 47 g +24 h

Green Shift Hacks 2026

THE PROBLEM

Electricity isn't equally clean all day.

California grid, modeled demo data · Curtailment: U.S. EIA, Today in Energy, May 2025

THE SOLUTION

Set a deadline. ShiftWatt picks the cleanest hours.

01

Read the forecast

48 hours of grid carbon intensity, every 30 minutes. Live for Great Britain.

02

Find the cleanest window

Checks every start time before your deadline, respecting quiet hours.

03

Run it and log it

Records grid intensity when it was ready vs. when it actually ran.

One EV charge
18 kWh

5.91 kg
1.10 kg

−81%
CO_2, and cheaper

THE IMPACT

Same habits. Less carbon.

≈500 kg

CO_2 avoided per year, one home with an EV

California, modeled

≈106 t

CO_2 per year if 2,400 students shift their laundry

No new hardware

±7 g

Forecast error on live UK grid data, checked against actuals

NESO Carbon Intensity API

Savings use average intensity, the conservative measure. Method and sources on Devpost.
